Brand New Book ***** Print on Demand *****.Modern fighter designs have been associated with lateral self-excited oscillations known as Wing Rock. Simulations of wing rock by flow visualization utilities have been encouraged to develop a complete understanding of the fluid mechanism that drives the motion as well as for prediction purposes. Previous wind/water tunnel simulations have been limited to a single degreeof- freedom (DoF) in roll. Numerical simulations utilizing computational fluid dynamics (CFD) have also been limited to a single DoF in roll and applied to simple flying delta-wing configurations. The loss of simulation accuracy due to reducing the actual wing rock six DoF to a single roll-only DoF has not as yet been fully investigated. In this study, for the first time, wing rock is computationally simulated in three DoF: roll, sideslip, and vertical motion to study the effect of adding the sideslip and vertical motion. The results are for a generic fighter model consisting of a fore-body, a cropped delta wing, and a vertical fin. The effect of including the vertical fin is also studied.Computational simulation of wing rock in three DoF for a full generic fighter model is a multidisciplinary problem involving grid generation (which requires the utilization of the multioverset mesh technique), aerodynamics, and rigid-body dynamics. The coupling of the flow governing equations and the rigid-body dynamics equations has been done utilizing an innovative sub-iterative scheme that works on the coupled set of equations. The advantage of implementing this sub-iterative scheme is to reduce the inherent time lag between the solutions of the aerodynamics and rigid-body dynamics.The interaction of aerodynamics and rigid-body dynamics during a single DoF wing rock for the wing-body configuration has been studied via snap shots of a...
